

National Performance Research Data Set (NPMRDS): Travel Time Probe Data

Northwestern Indiana Regional Planning Commission

Topics Presentation Will Cover:

- What is the NPMRDS?
- How is the NPMRDS used?
- What Performance Measures can the NPMRDS generate?

here

NPMRDS: Overview

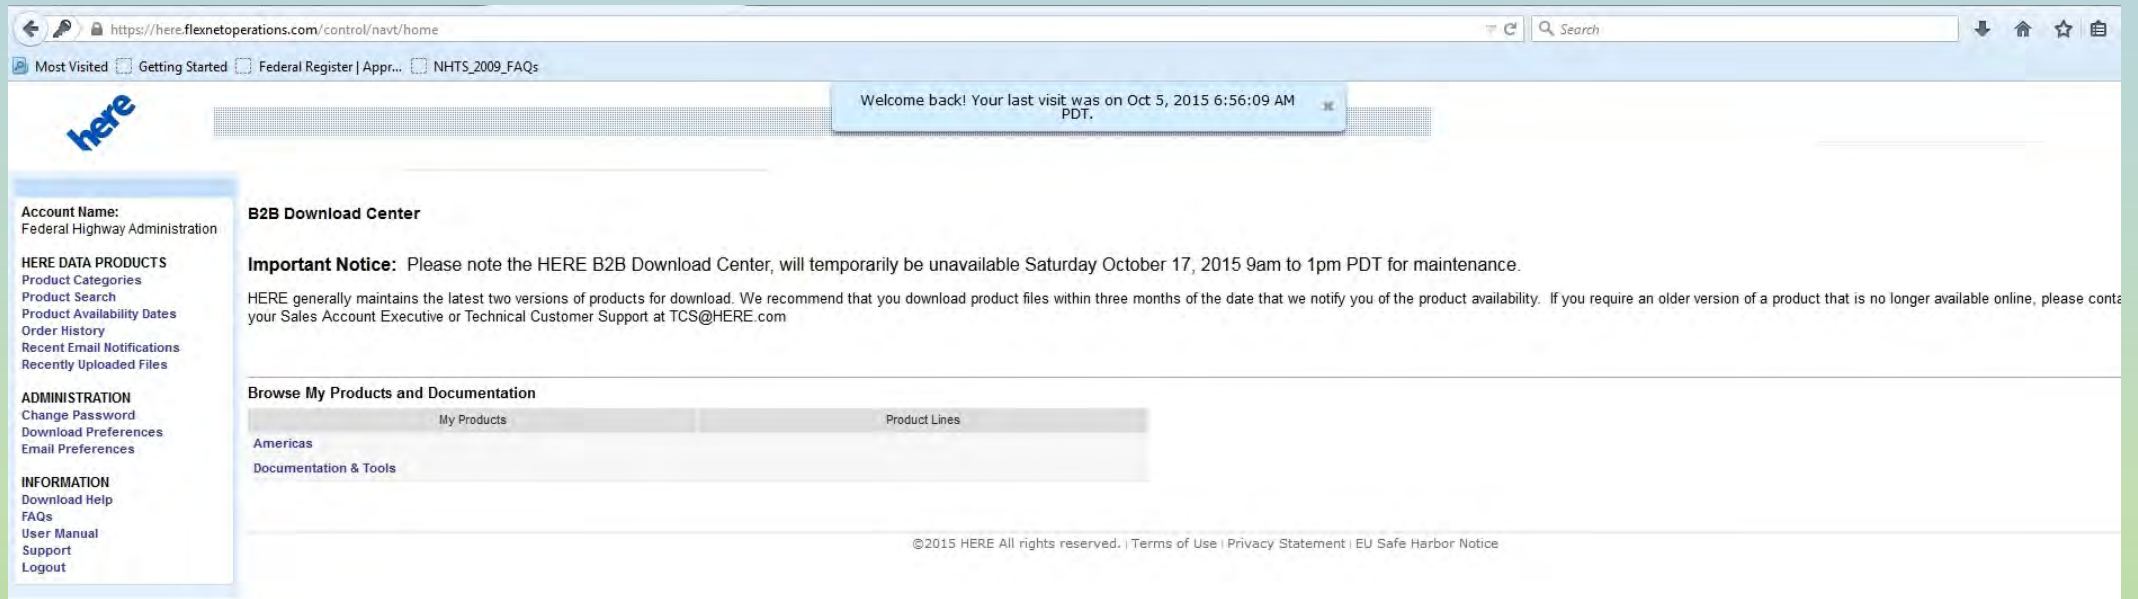

- Data is sourced from vehicle probes (GPS devices and cell phones)
- HERE is the licensed packager and vendor of the data
- FHWA Office of Freight Management and Operations entered into a contract with HERE to access the data on the National Highway System
- State DOTs and MPOs are eligible via agreement with FHWA and HERE to access the data

Accessing the NPMRDS Data

Must be an MPO, State DOT, or U.S. DOT user

1. Email heretraffic.nhsdata@here.com and request access
2. Visit <https://here.flexnetoperations.com> and login

3. Click Americas -> Additional Content Americas, find the month and region and begin the download

Accessing the NPMRDS Data Cont'd

4. Download the newest Shapefile and Static File
5. Unzip the data and shapefile
6. Open and use the data in SQL program of choice
7. Display the Data in GIS and Join using shapefile

How NPMRDS Data Comes In

- National Highway System divided into Traffic Message Channel (TMC) codes approx. 0.5 – 8 miles
- Data comes in at 5-minute intervals called epochs for travel times across a TMC (1 day = 288 epochs)
- Travel Times reported for 3 categories: All vehicles, Passenger vehicles, and Freight trucks

Scratch pad

How Travel Time is Measured

Assume Simple Case: 2-lane Highway with 2 vehicles traversing in 1 epoch

Travel Time for
Passenger Vehicles
= **26 seconds**

Travel Time for
Freight Trucks =
30 seconds

Travel Time for All Vehicles = **28 seconds**

How Speed is Calculated

Assume Simple Case: 2-lane Highway with 2 vehicles traversing in 1 epoch

Speed for
Passenger Vehicles
= $0.5 \text{ miles} / (26 \text{ sec} / 3600 \text{ sec per hour})$ = **68 mph**

Speed for Freight
Trucks = $0.5 \text{ miles} / (30 \text{ sec} / 3600 \text{ sec per hour})$ = **60 mph**

Speed for All Vehicles = **64 mph**

Travel Time Takeaways from the Data

- Pros:

- No Requirement for actively collecting data
- Very fine resolution of 5-minute intervals
- Distinction between passenger and freight

- Cons:

- Sample size is unknown
- A lot of blanks in the data with no processing
- Only data coverage of National Highway System

Uses for the NPMRDS

- Performance Based Planning (PBP)
 - Required under MAP-21
 - Mobility is planning factor #4 and system efficiency #7
 - Congestion Reduction and System Reliability are national performance goals
- Congestion Management Process (CMP)
 - Required for all Transportation Management Areas (MPO greater than 200,000 people)
 - Data helps define congested network and track progress

NIRPC's Use of NPMRDS for PBP

- 5 out of 86 performance measures/targets identified in the NIRPC 2040 Comprehensive Regional Plan
 - Travel Time & Travel Time Index
 - Average Speed
 - Delay
 - Average speeds on freight-significant highways
 - Average peak and off-peak travel times for trucks in freight significant corridors
- Congestion Reduction and System Reliability expected to have Notice of Proposed Rulemakings

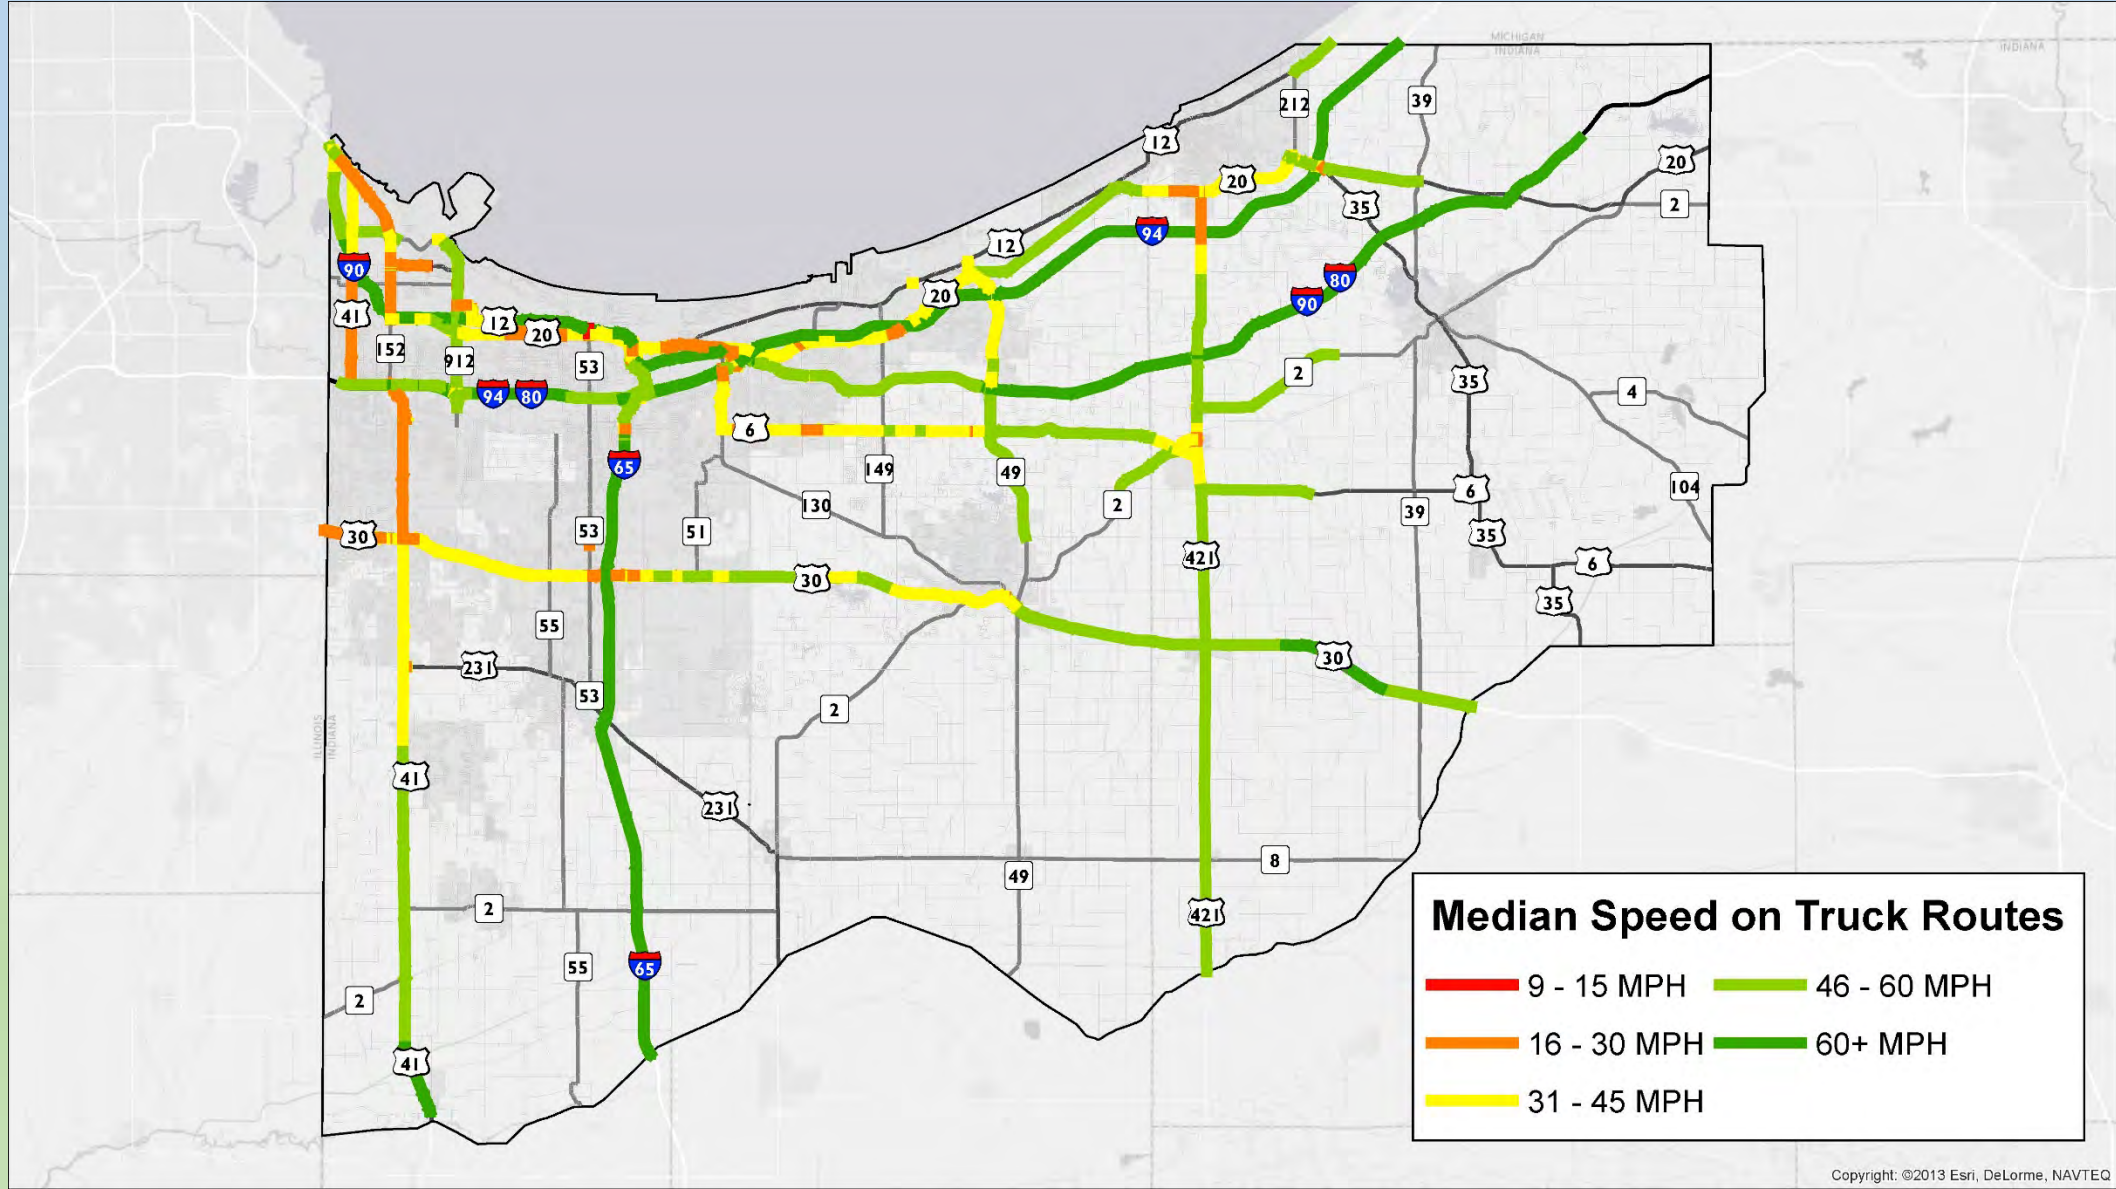

Travel Time Index

1.00 - 1.25	1.76 - 2.00
1.26 - 1.50	2.01 - 3.00
1.51 - 1.75	3.01 - 36.00

Average (Median) Speed

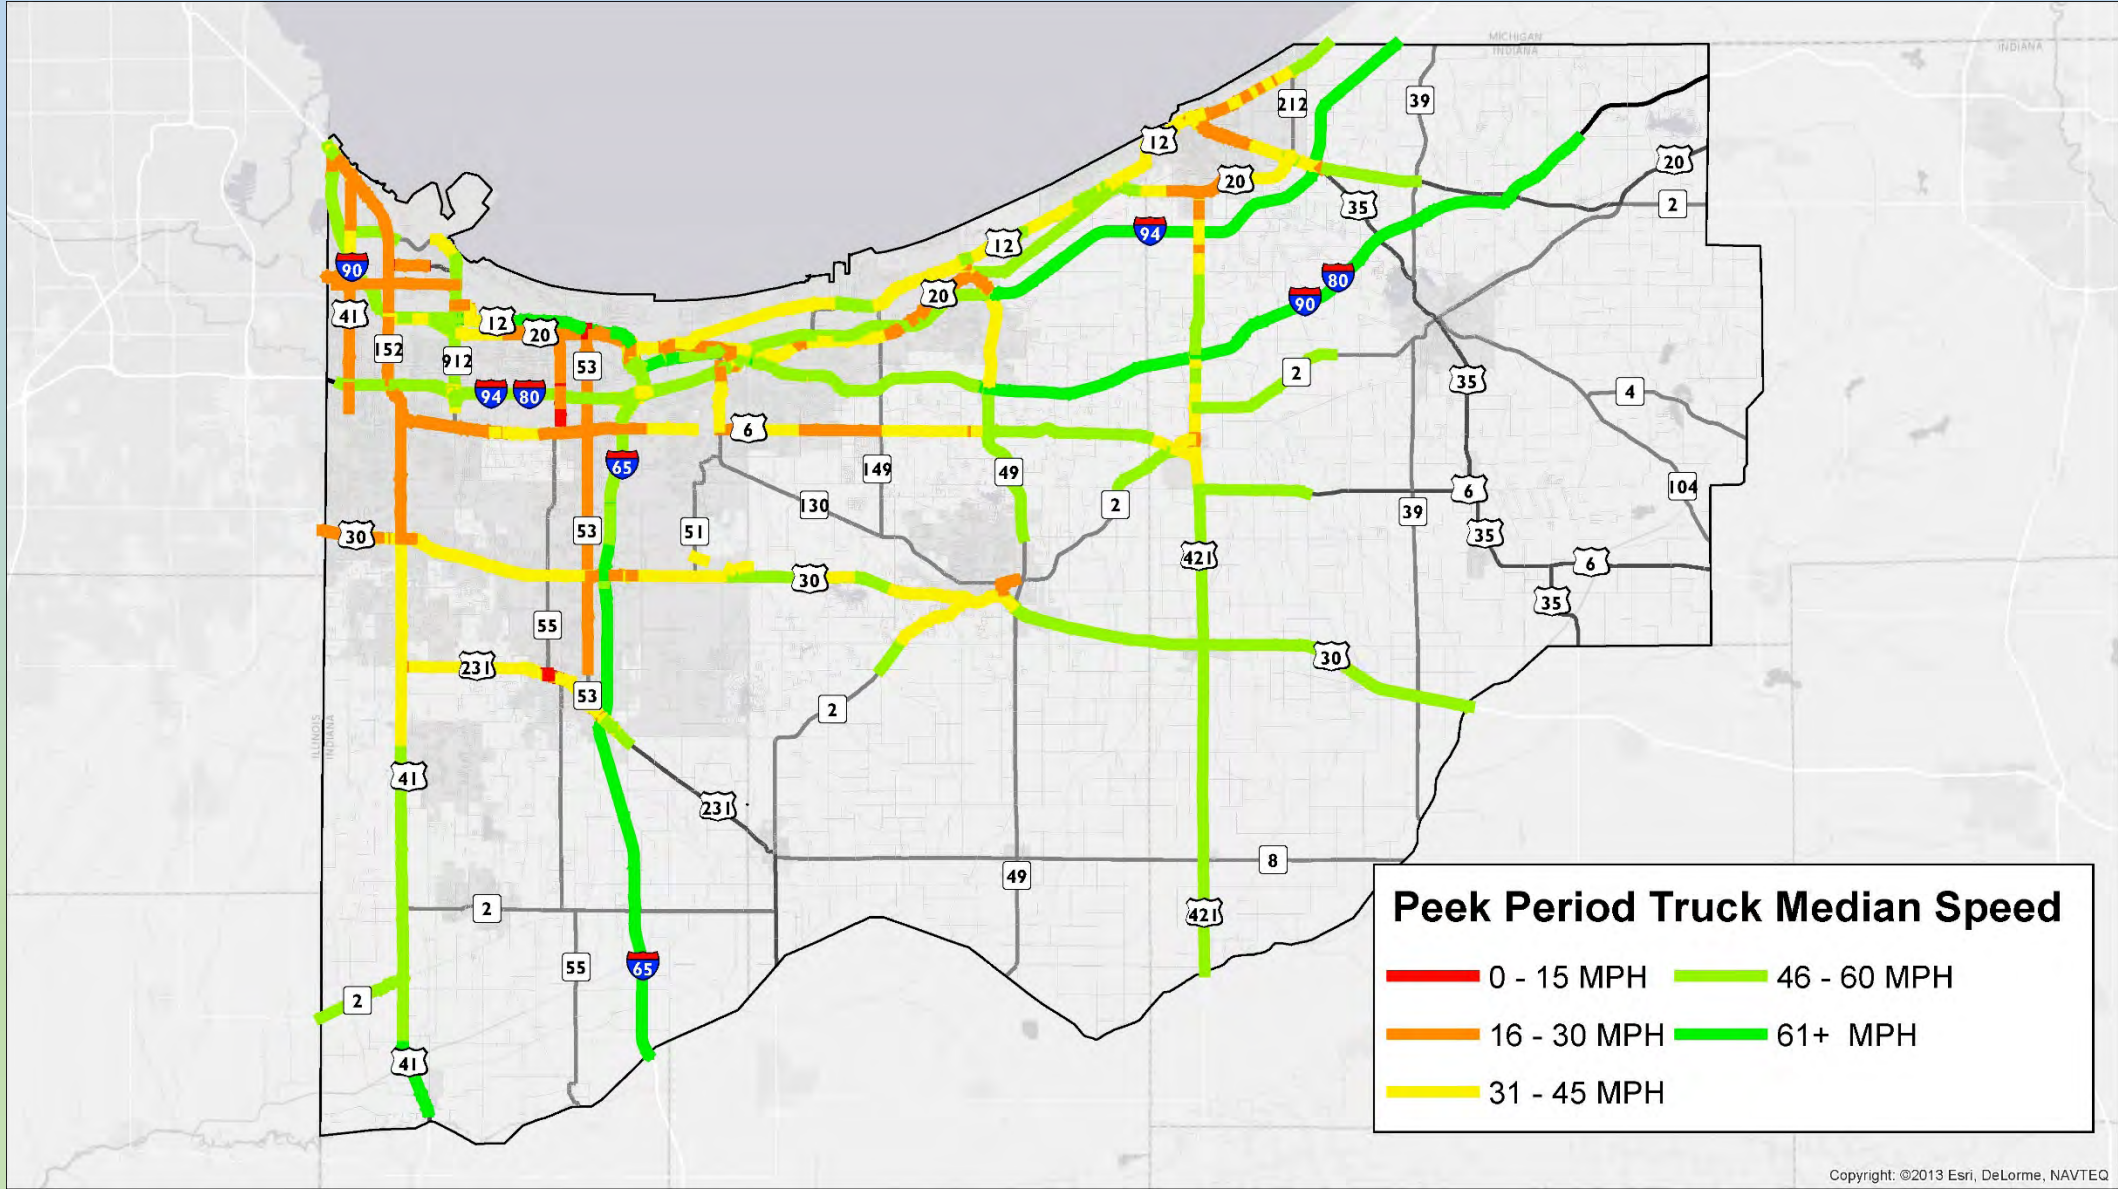

Delay

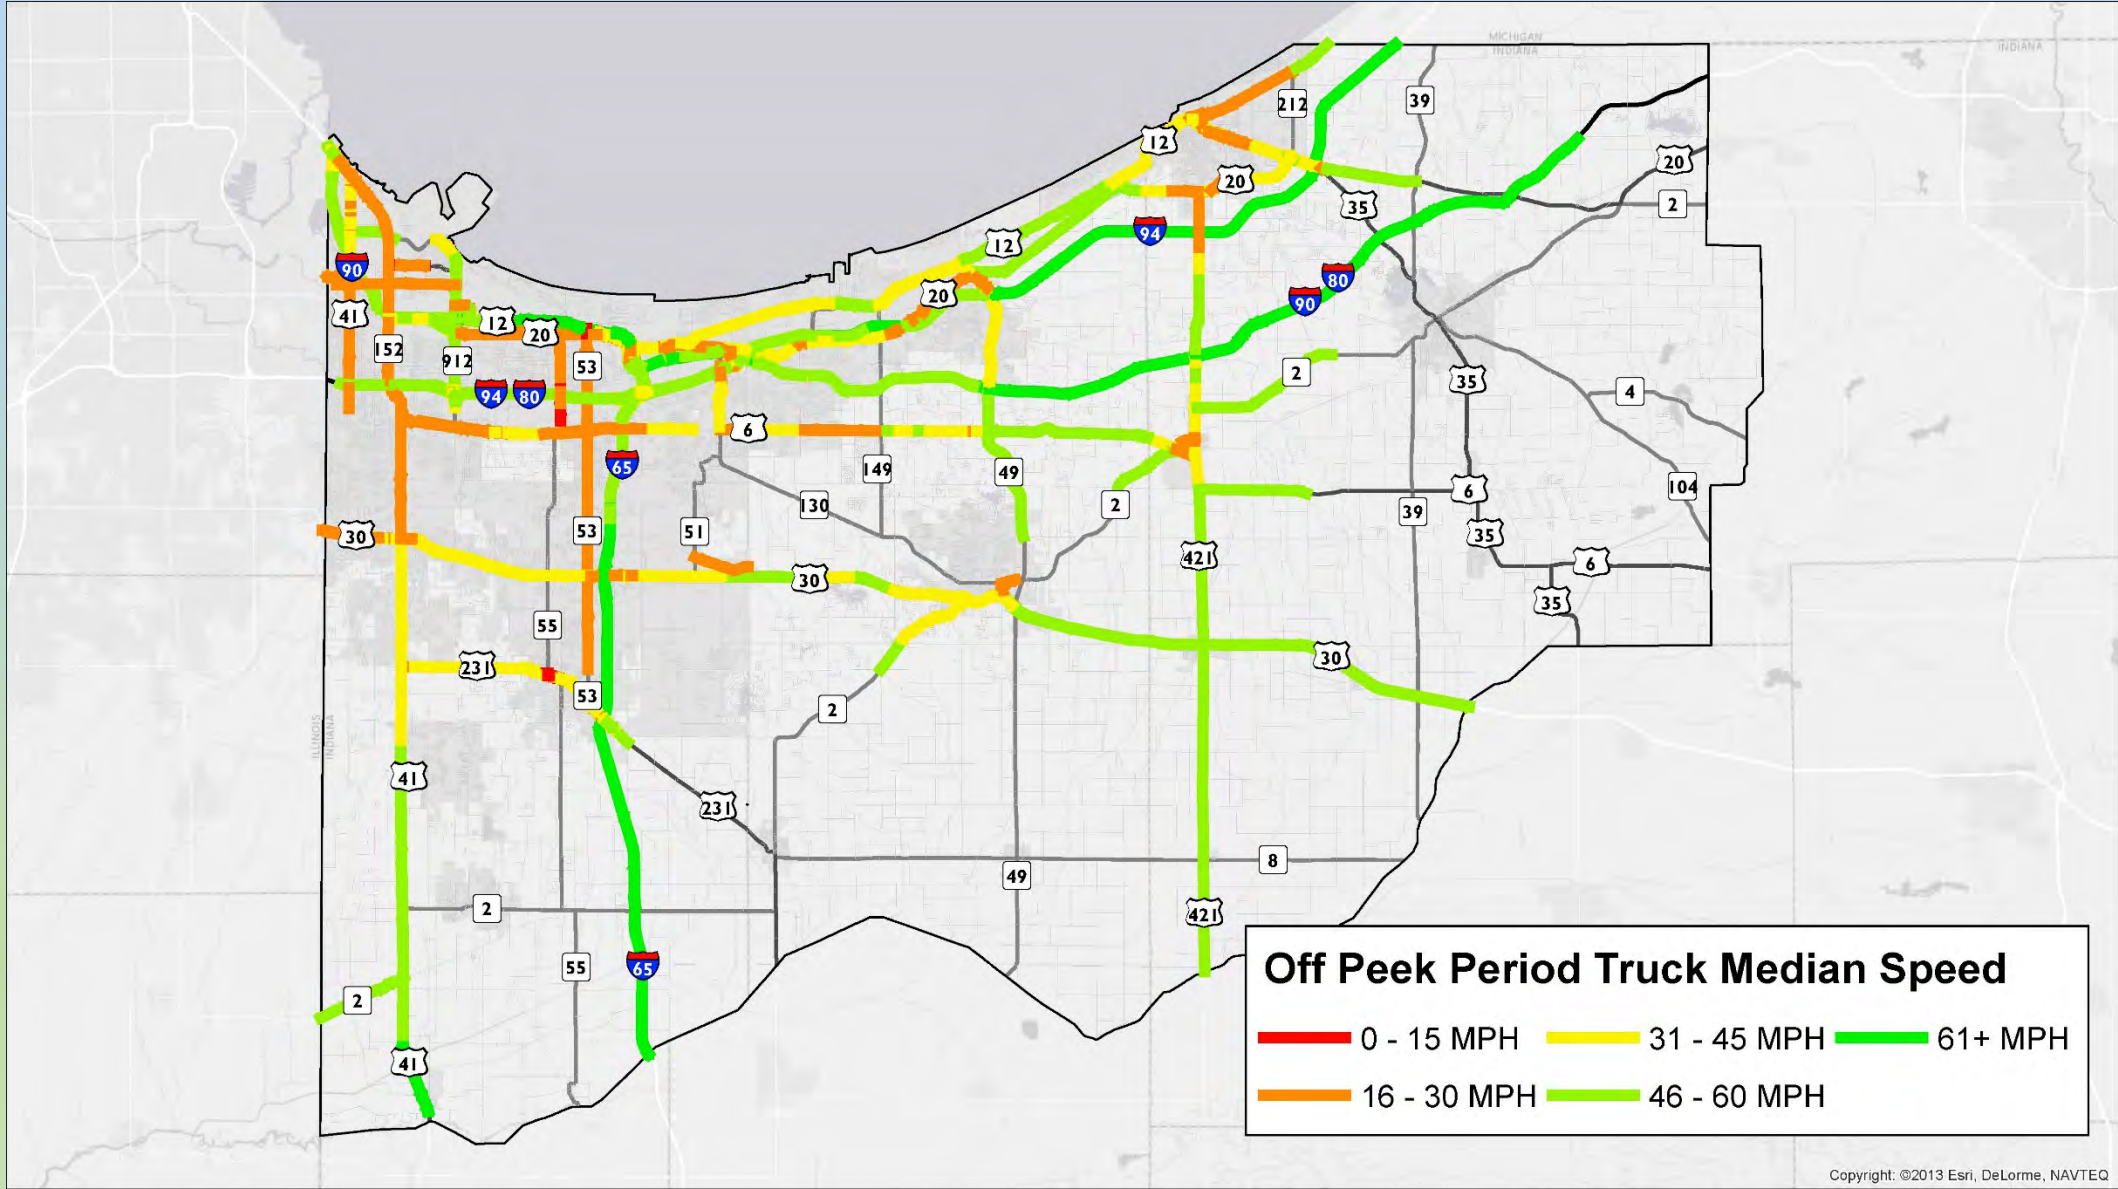

Average Speed on Truck Routes

Average Truck Speed in Peak Period

Average Truck Speed in Off-Peak Period

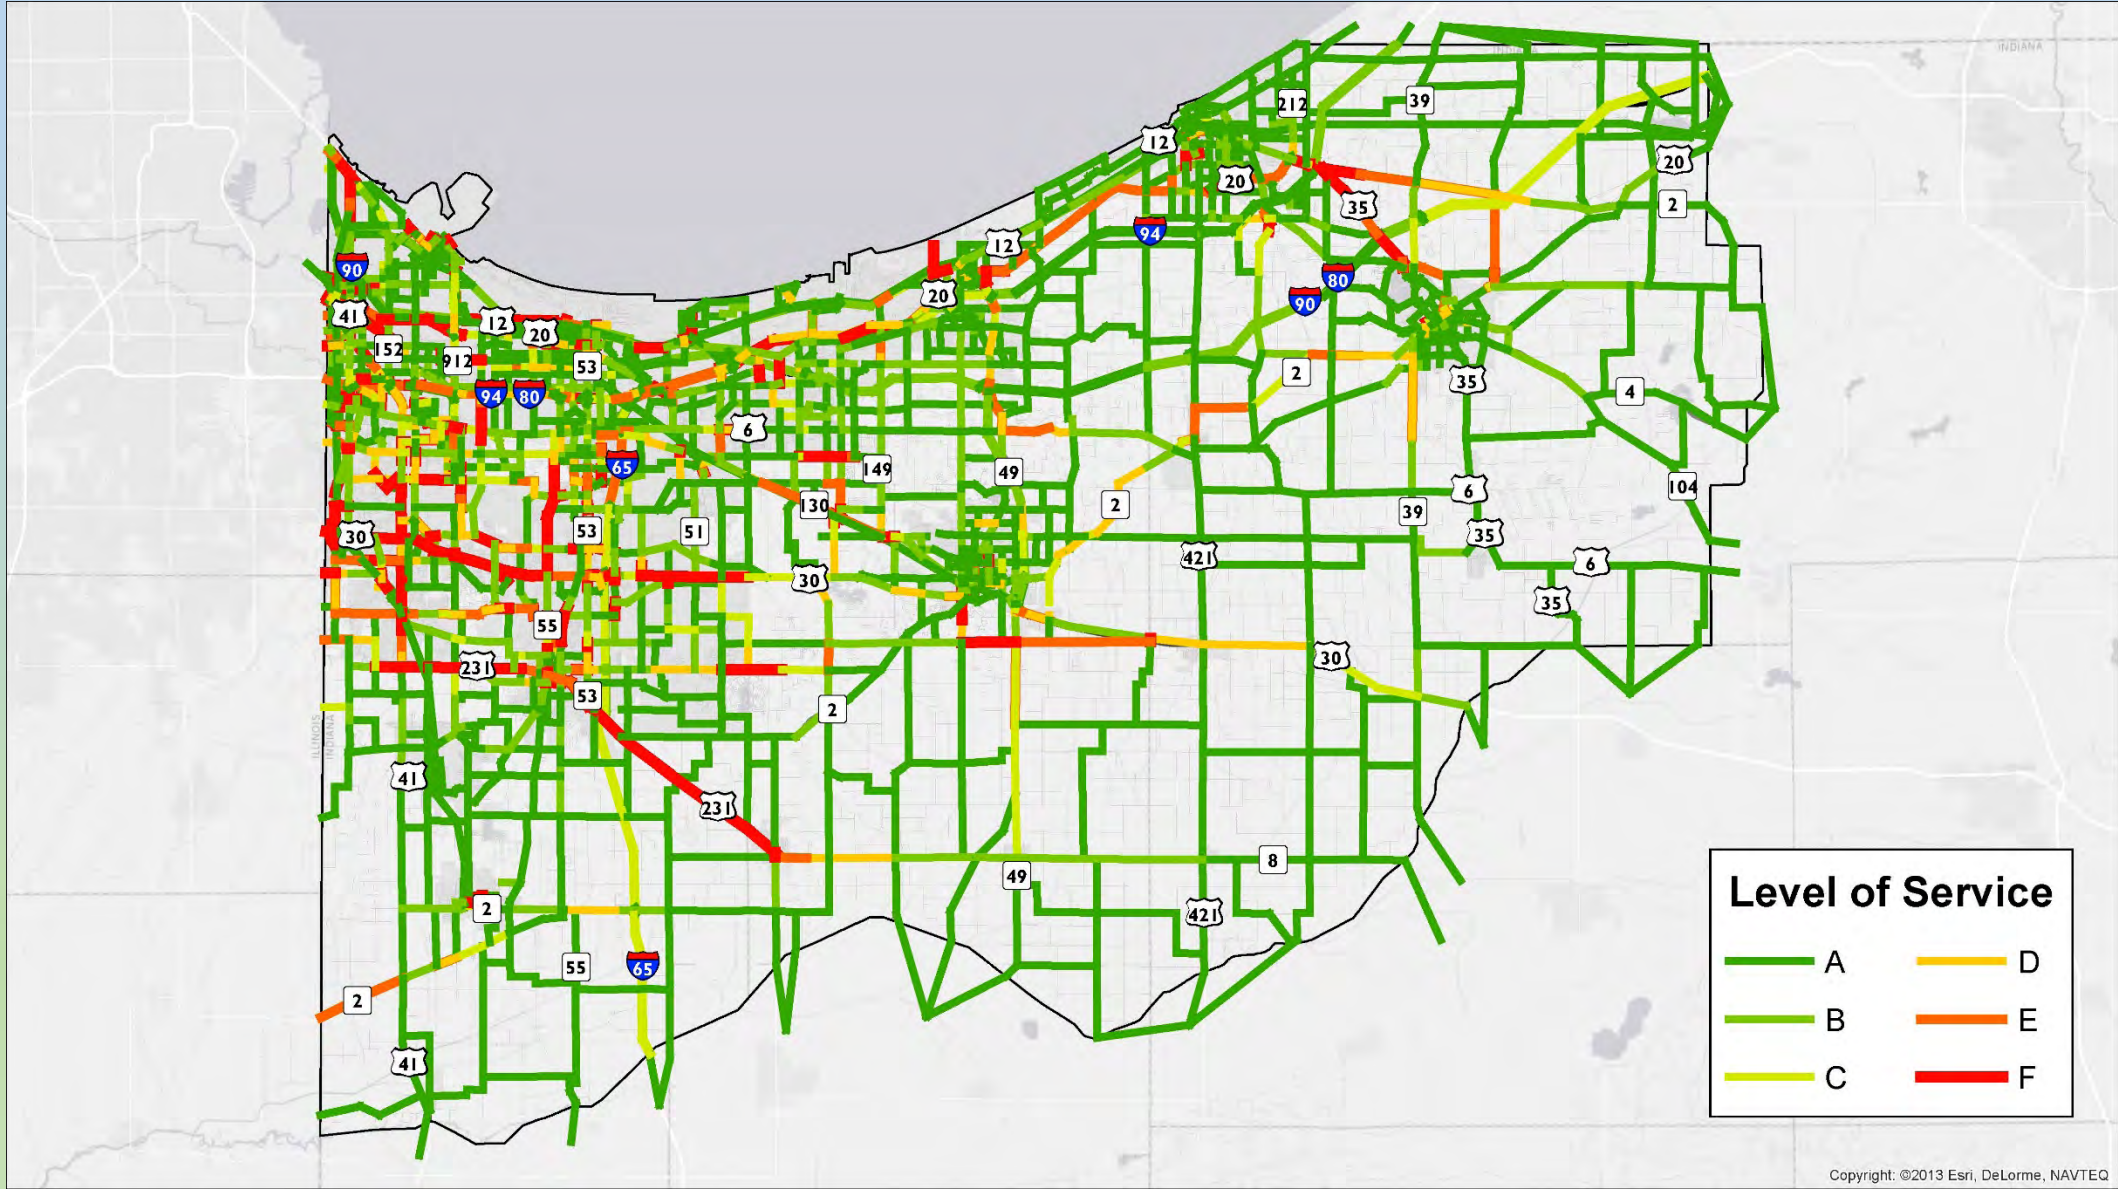

NIRPC's Use of NPMRDS for CMP

- In addition to all of the targets from PBP, NPMRDS helps identify congested network
- Monthly data at 5-min intervals allows tracking progress of major projects

Conclusions/Takeaways

- NPMRDS is a Free (for most) travel time dataset
- NPMRDS is probe-based with data every 5-min
- Travel Times allow analysis of speed, delay, travel time index, planning time index, etc.
- NPMRDS helps MPOs with Performance Based Planning and Congestion Management Process
